Access to your apps

You received two things, by different routes:

- a certificate file, `client.p12`
- its password

Keep both private. Anyone with both can enable access to the apps, so do not forward them. The administrator gives you the **Portal address**: `https://_____`.

1. Install the certificate

Android (Chrome)

1. Save `client.p12` on the phone.
2. Open Settings and search for "certificate". Choose **Install a certificate**, then **VPN & app user certificate**. The menu names differ by vendor and Android version; a screen lock must be set.
3. Pick `client.p12` and enter the password.

iPhone (Safari)

1. Open `client.p12` from Files, Mail or AirDrop. iOS says "Profile Downloaded".
2. Open Settings and tap **Profile Downloaded** at the top. If it is missing, go to General, VPN & Device Management.
3. Tap **Install**, enter the phone passcode and the certificate password.

Install it once per device.

2. Bookmark the Portal

Open the Portal address and add it to your bookmarks or home screen. When the browser asks which certificate to use, pick the one you installed.

3. Enable access

Open the bookmark and tap **Enable access**. The page shows "Available until" with a date. Your apps then work on this connection until that time, with their usual login.

- Tap **Extend access** to start the full period again.
- **Disable access for this connection** ends it early.
- A new connection needs it again, for example mobile data instead of Wi-Fi, another Wi-Fi, or a VPN. The Portal then says "Your connection changed."
- On your home network the Portal says "You're on your home network." Nothing to do.

TV and other devices

A TV cannot install the certificate and does not need to. It uses the Wi-Fi's connection, so enable access from a phone on the same Wi-Fi as the TV, then open the app on the TV.

If something does not work

What you see	Meaning	Do
An app shows **Forbidden** (403)	Access is not enabled for this connection, or it expired	Open the Portal and tap **Enable access**
Forbidden right after enabling	The apps may see another address than the Portal	Open **Troubleshooting** in the Portal and send the Address and Family to the administrator
The Portal does not open, or the browser shows an SSL or certificate error	The certificate is missing, wrong or expired	Install it again; ask the administrator for a new file
"We couldn't enable access."	The service is unavailable	Tap **Try again**; if it persists, tell the administrator
"Please wait a moment before trying again."	Too many attempts	Wait for the countdown
